

## **ABSTRACT OF THE DISCLOSURE**

An electronic card includes two shells juxtaposed to each other, and a frame mounted between the two shells. The frame has two sides each formed with a locking groove, and each of the two shells has two sides each formed  
5 with a locking hook detachably locked in the respective locking groove of the frame. Thus, the electronic card is manufactured easily, thereby greatly decreasing costs of fabrication of the electronic card. In addition, the user only needs to remove one of the two shells from the frame to expose the circuit board, thereby facilitating maintenance of the circuit board.
